

## TOOLSTICK C8051F327 DAUGHTER CARD USER'S GUIDE

## 1. Handling Recommendations

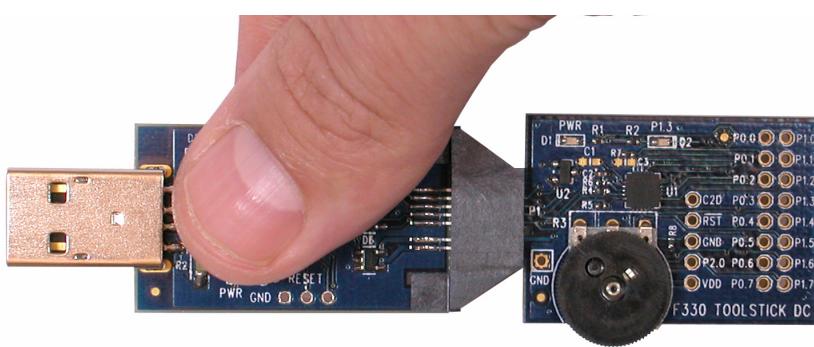

To enable development, the ToolStick Base Adapter and daughter cards are distributed without any protective plastics. To prevent damage to the devices and/or the host PC, please take into consideration the following recommendations when using the ToolStick:

- Never connect or disconnect a daughter card to or from the ToolStick Base Adapter while the Base Adapter is connected to a PC.
- Always connect and disconnect the ToolStick Base Adapter from the PC by holding the edges of the boards.

**Figure 1. Proper Method of Holding the ToolStick**

- Avoid directly touching any of the other components.

**Figure 2. Improper Method of Holding the ToolStick**

- Manipulate mechanical devices on the daughter cards, such as potentiometers, with care to prevent the Base Adapter or daughter card from accidentally dislodging from their sockets.

# ToolStick-F327DC

## 2. Contents

The ToolStick-F327DC kit contains the following items:

- ToolStick C8051F327 Daughter Card

A ToolStick daughter card requires a ToolStick Base Adapter to communicate with the PC. ToolStick Base Adapters can be purchased at [www.silabs.com/toolstick](http://www.silabs.com/toolstick).

## 3. ToolStick Overview

The purpose of the ToolStick is to provide a development and demonstration platform for Silicon Laboratories microcontrollers and to demonstrate the Silicon Laboratories software tools, including the Integrated Development Environment (IDE).

The ToolStick development platform consists of two components: the ToolStick Base Adapter and a daughter card. The ToolStick Base Adapter provides a USB debug interface and data communications path between a Windows PC and a target microcontroller.

The C8051F327 Daughter Card includes a pair of LEDs, a micro USB connector, a switch connected to a GPIO, and a small prototyping area which provides access to all of the pins of the device. This prototyping area can be used to connect additional hardware to the microcontroller and use the daughter card as a development platform.

Figure 3 shows the ToolStick C8051F327 Daughter Card and identifies the various components.

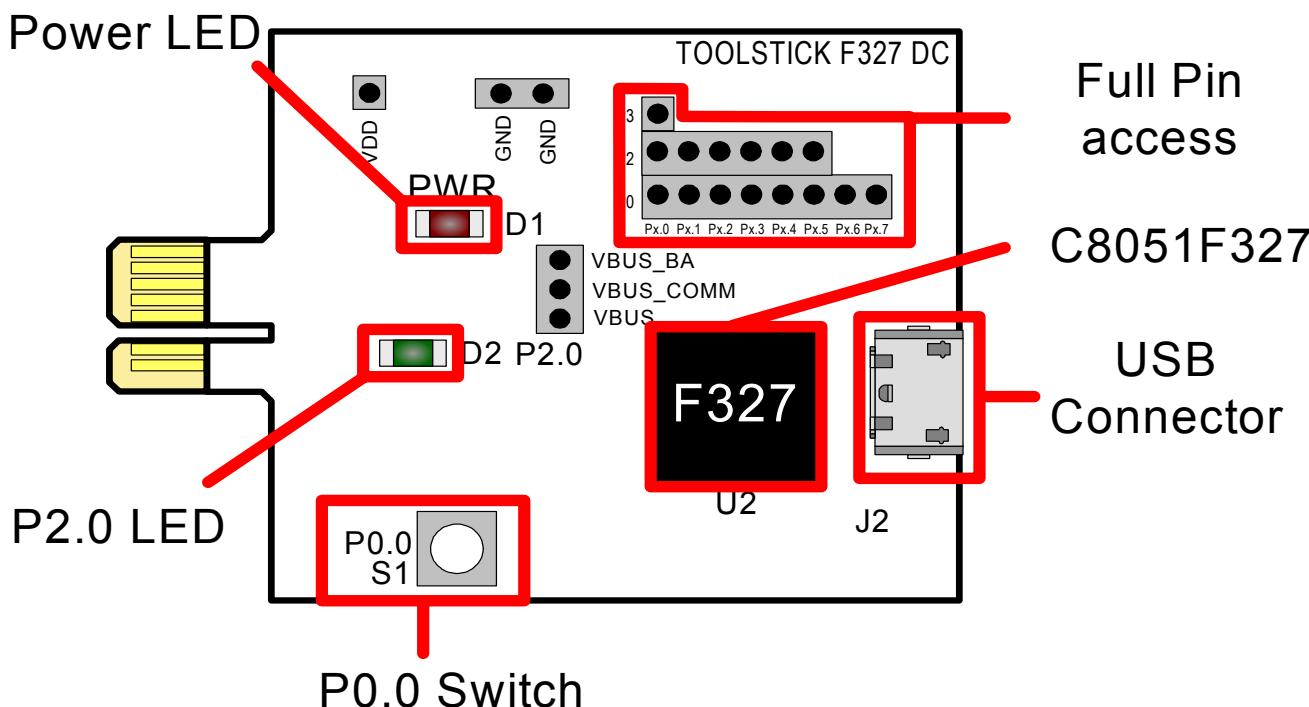

Figure 3. ToolStick C8051F327 Daughter Card

## 4. Getting Started

The necessary software to download, debug and communicate with the target microcontroller must be downloaded from [www.silabs.com/toolstick](http://www.silabs.com/toolstick). The following software is necessary to build a project, download code to, and communicate with the target microcontroller:

- Silicon Laboratories Integrated Development Environment (IDE)
- Keil Demonstration Tools
- ToolStick Terminal application

The Keil Demo Toolset includes a compiler, assembler, and linker. See Section “5.2.2. Keil Demonstration C51 C Compiler” for more details about the demo tools. ToolStick Terminal communicates with the target microcontroller’s UART through the ToolStick Base Adapter. It can also read/write the two GPIO pins available on the ToolStick Base Adapter.

Other useful software that is provided on the Silicon Labs Downloads ([www.silabs.com/mcudownloads](http://www.silabs.com/mcudownloads)) website includes:

- Configuration Wizard 2
- Keil uVision2 and uVision3 Drivers

The software described above is provided in several download packages. The ToolStick download package includes example code, documentation, including user’s guides and data sheets, and the ToolStick Terminal application. The IDE, Keil Demonstration Tools, Configuration Wizard 2, and the Keil µVision Drivers are available as separate downloads. After downloading and installing these packages, see the following sections for information.

## 5. Software Overview

### 5.1. Silicon Laboratories IDE

The Silicon Laboratories IDE integrates a source code editor, source-level debugger, and an in-system Flash programmer. See Section “6. ToolStick C8051F327 Daughter Card Features Demo” for detailed information on how to use the IDE. The Keil Demonstration Toolset includes a compiler, linker, and assembler and easily integrates into the IDE. The use of third-party compilers and assemblers is also supported.

#### 5.1.1. IDE System Requirements

The Silicon Laboratories IDE requirements:

- Pentium-class host PC running Microsoft Windows 2000 or newer.
- One available USB port.

#### 5.1.2. 3rd Party Toolsets

The Silicon Laboratories IDE has native support for many 8051 compilers. The full list of natively supported tools is:

- Keil
- IAR
- Raisonance
- Tasking
- Hi-Tech
- SDCC

Please note that the demo applications for the C8051F327 Daughter Card are written for the Keil toolset.

# ToolStick-F327DC

## 5.2. Keil Demonstration Toolset

### 5.2.1. Keil Assembler and Linker

The Keil demonstration toolset assembler and linker place no restrictions on code size.

### 5.2.2. Keil Demonstration C51 C Compiler

The evaluation version of the C51 compiler is the same as the full version with the following limitations:

- Maximum 4 kB code generation.
- There is no floating point library included.
- When initially installed, the C51 compiler is limited to a code size of 2 kB, and programs start at code address 0x0800. Refer to "AN104: Integrating Keil Tools into the Silicon Labs IDE" for instructions to change the limitation to 4 kB and have the programs start at code address 0x0000.

## 5.3. Configuration Wizard 2

The Configuration Wizard 2 is a code generation tool for all of the Silicon Laboratories devices. Code is generated through the use of dialog boxes for each of the device's peripherals.

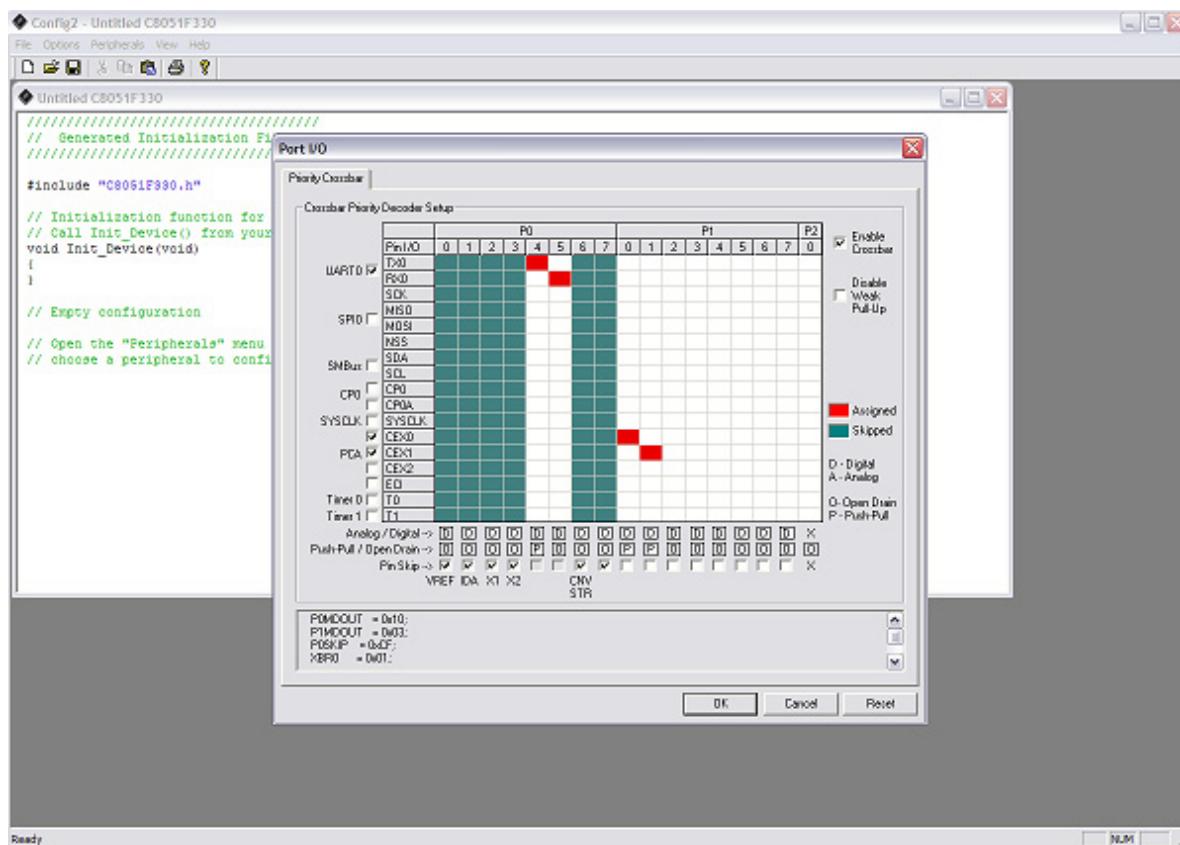

Figure 4. Configuration Wizard 2 Utility

The Configuration Wizard 2 utility helps accelerate development by automatically generating initialization source code to configure and enable the on-chip resources needed by most design projects. In just a few steps, the wizard creates complete startup code for a specific Silicon Laboratories MCU. The program is configurable to provide the output in C or assembly.

For more information, please refer to the Configuration Wizard 2 documentation. The documentation and software available from the Downloads webpage ([www.silabs.com/mcudownloads](http://www.silabs.com/mcudownloads)).

## 5.4. Keil uVision2 and uVision3 Silicon Laboratories Drivers

As an alternative to the Silicon Laboratories IDE, the uVision debug driver allows the Keil uVision2 and uVision3 IDEs to communicate with Silicon Laboratories on-chip debug logic. In-system Flash memory programming integrated into the driver allows for rapidly updating target code. The uVision2 and uVision3 IDEs can be used to start and stop program execution, set breakpoints, check variables, inspect and modify memory contents, and single-step through programs running on the actual target hardware.

For more information, please refer to the uVision driver documentation. The documentation and software are available from the Downloads webpage ([www.silabs.com/mcudownloads](http://www.silabs.com/mcudownloads)).

## 5.5. ToolStick Terminal

The ToolStick Terminal program provides the standard terminal interface to the target microcontroller's UART. However, instead of requiring the usual RS-232 and COM port connection, ToolStick Terminal uses the USB interface of the ToolStick Base Adapter to provide the same functionality.

In addition to the standard terminal functions (send file, receive file, change baud rate), two GPIO pins on the target microcontroller can be controlled using the Terminal for either RTS/CTS handshaking or software-configurable purposes (see the demo software for an example).

See Section "6.8. Using ToolStick Terminal," on page 12 for more information. The software is available on the ToolStick webpage ([www.silabs.com/toolstick](http://www.silabs.com/toolstick)).

# ToolStick-F327DC

## 6. ToolStick C8051F327 Daughter Card Features Demo

The ToolStick kit includes a few simple code examples. The example described in this section is titled **F327DC\_FeaturesDemo**. The purpose of this example is to guide a new user through the features and capabilities of the IDE and demonstrate the microcontroller's on-chip debug capabilities. The **F327DC\_FeaturesDemo** example code uses the switch on the daughter card to vary the blinking rate of the LED. The first part of this demo shows how to use the IDE to connect and download the firmware, view and modify registers, use watch windows, use breakpoints, and single step through code. The second part of the demo shows how to use ToolStick Terminal to receive UART data from the daughter card and how to use the GPIO pins.

### 6.1. Hardware Setup

Connect the ToolStick hardware to the PC using the steps below while taking note of the recommendations in Section 1:

1. Connect the ToolStick Base Adapter to the ToolStick C8051F327 Daughter Card.
2. If available, connect the USB extension cable to the ToolStick Base Adapter.
3. Connect the ToolStick to a USB port on a PC.

See Figure 5 below for an example hardware setup using the C8051F330 ToolStick Daughter Card.

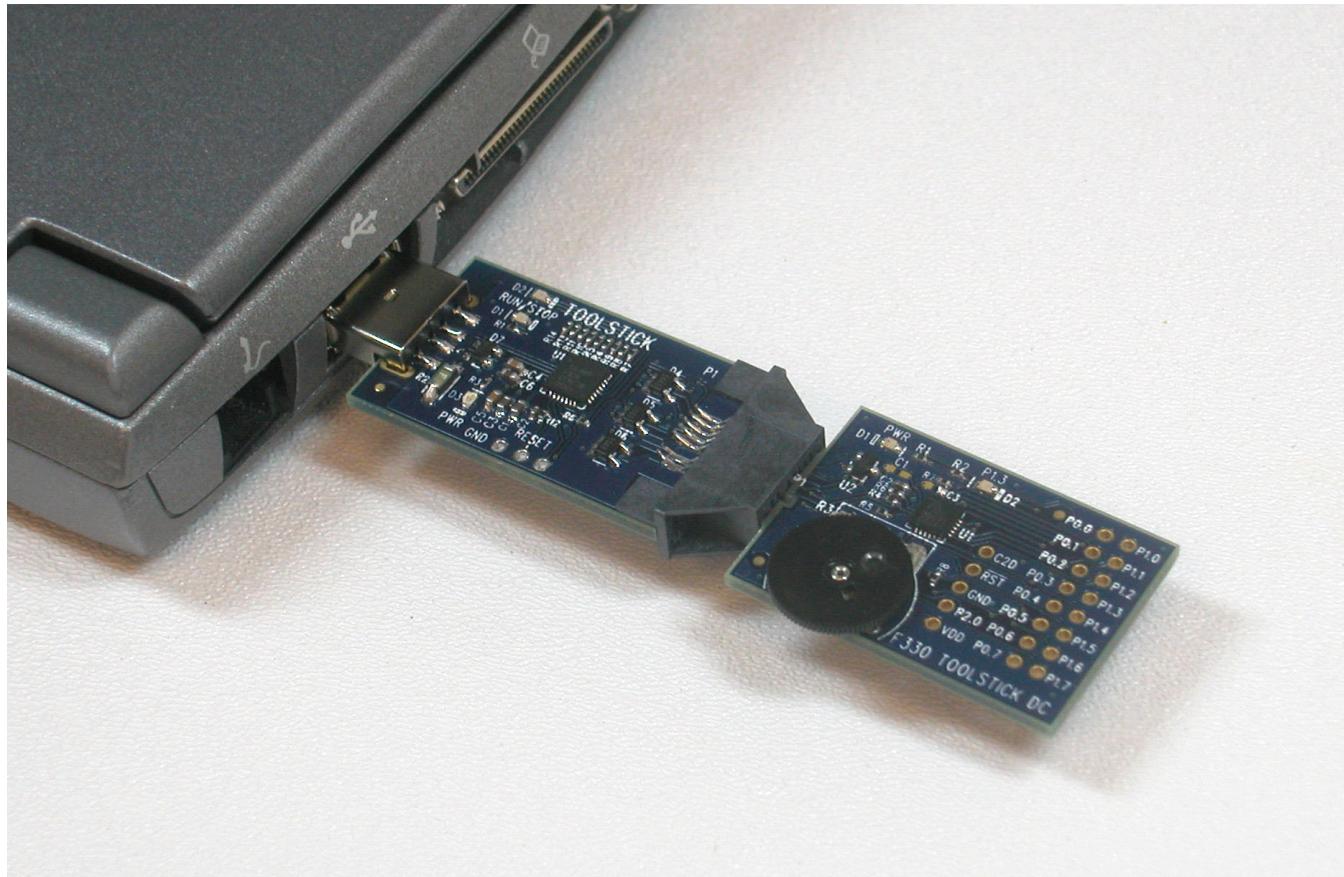

Figure 5. Hardware Setup Example

## 6.2. Connecting to the Device and Downloading Firmware

This section describes how to open the IDE, open and build a project, connect to a device and download the firmware.

1. Open the Silicon Laboratories IDE from the **Start → Programs → Silicon Laboratories** menu.
2. In the IDE, go to **Project → Open Project**.
3. Browse to the default location, **C:\SiLabs\MCU\ToolStick\F327DC\Firmware**.
4. Select **F327DC\_FeaturesDemo.wsp** and click **OK**.
5. In the IDE, select **Project → Rebuild Project**.
6. Go to **Options → Connection Options**.
7. Select “**USB Debug Adapter**” for the Serial Adapter and “**C2**” for the Debug Interface, and then click “**OK**”.
8. Go to **Debug → Connect**.
9. Download the code using the **download button** on the menu bar or use alt-D.

Once these steps are completed, the firmware is built into an object file (step 5) and downloaded to the device (step 9). The device is now ready to begin executing code. If all of these steps were followed successfully, the “Go” option is enabled in the Debug menu. A green circle icon in the IDE toolbar also indicates that the device is ready to run. If one of the steps leads to an error, make sure that the ToolStick is properly inserted in a USB port and start again with step 6.

## 6.3. Running and Stopping Code Execution

Once the IDE is connected to the device and the firmware is loaded, the IDE can start and stop the code execution. The following steps can be performed using the buttons on the toolbar or using the options in the Debug menu.

1. To start code execution, click the green “**Go**” button on the toolbar or use the **Debug → Go** menu option. The green LED on the daughter card will start to flash. The debug commands in the IDE (single-step, multiple-step, set breakpoint, and others) are disabled when the device is running. While the firmware is running, the button labeled P0.0 can also be pressed to toggle the LED on and off.

2. To stop code execution, click the red “**Stop**” button on the toolbar or use the **Debug → Stop** menu option. The device will halt code execution and all of the registers and pins on the device will hold their state.

All debug windows and watch windows are refreshed when the device is stopped. If any of the values in these windows have changed since the last time the device was halted, the new value is shown in red text instead of black text.

# ToolStick-F327DC

## 6.4. Viewing and Modifying Registers

All registers on the device can be viewed and modified when the device is in a halted state. The registers are grouped together according to which peripheral or part of hardware they belong. As an example, this guide shows how to open the Timers Debug Window and disable a timer directly from the IDE.

1. Open the Timers Debug Window from the **View→Debug Windows→SFR's→Timers** menu option. The Timers Debug Window appears on the right-hand side of the IDE. In this window, the **TCON** register is shown. This register is used to enable and configure the on-chip timers. When the firmware is running, the **TCON** register reads as 0x1A indicating that timer 0 and timer 1 are running.

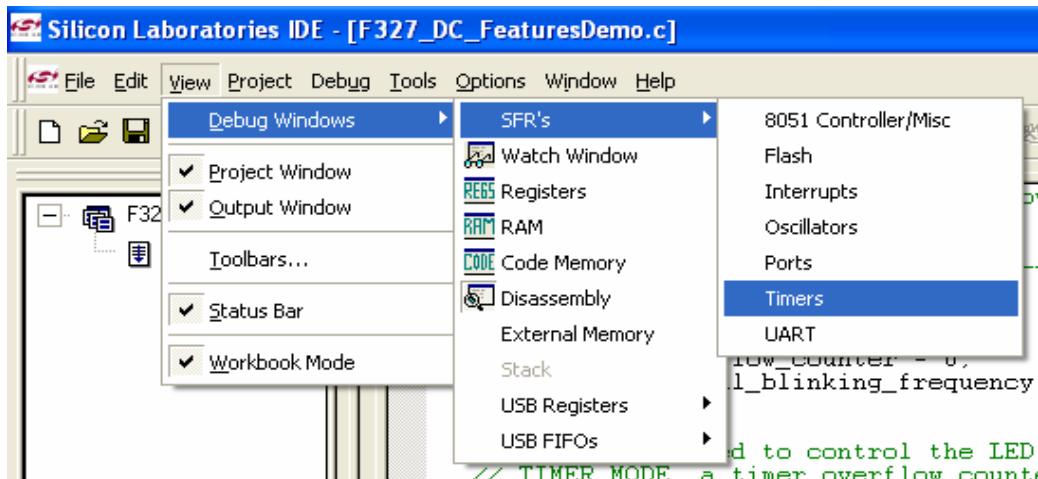

Figure 6. Timers

2. In the debug window, change the value of **TCON** from 0x1A to 0x0A. This value turns off Timer 0 on the microcontroller.

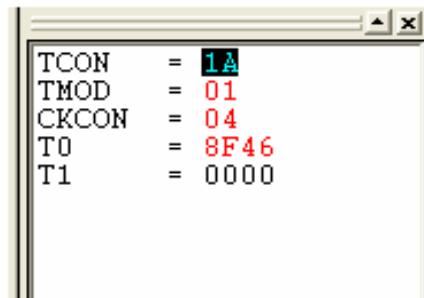

Figure 7. Debug Window

3. To write this new value to the device, select Refresh from the Debug Menu or click the Refresh button in the toolbar.

Figure 8. Refresh Button

4. Click "Go" to resume running the device with the new **TCON** value.
5. Press the button on the daughter card and notice that it has no effect on the LED.
6. Re-enable timer 0 by writing 0x1A to **TCON** and clicking the Refresh button.

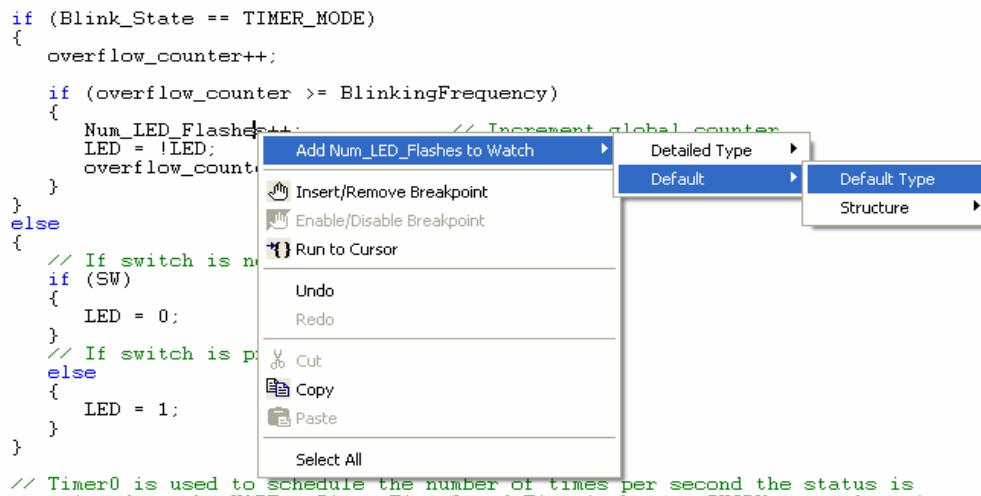

Changing the values of registers does not require recompiling the code and redownloading the firmware. At any time, the device can be halted and the values of the registers can be changed. After selecting "Go", the firmware will continue **execution** using the new values. This capability greatly speeds up the debugging process. See the data sheet for the C8051F326/7 device family for the definitions and usage for all registers.

The debug windows for other sets of registers are found in the **View→Debug Windows→SFR's** menu.

## 6.5. Enabling and Using Watch Windows

The Debug Windows in the View menu are used to view and modify hardware registers. To view and modify variables in code, the IDE provides Watch Windows. Just as with register debug windows, variables in the watch windows are updated each time the device is halted. This section of the User's Guide explains how to add a variable to the watch window and modify the variable. In the **F327DC\_FeaturesDemo** example code, the variable **Num\_LED\_Flashes** is a counter that stores the number of times the LED blinks.

1. If the device is running, stop execution using the "**Stop**" button or use the **Debug→Stop** menu option.
2. In the File View on the left-hand side of the IDE, double-click on **F327DC\_FeaturesDemo.c** to open the source file.
3. Scroll to the **TIMER0\_ISR** function and right-click on the variable "**Num\_LED\_Flashes**". In the context menu that appears, select "**Add Num\_LED\_Flashes to Watch**" and then choose "**Default**." On the right-hand portion of the IDE, the watch window appears and the variable is added. The current value of the variable is shown to the right of the name.

**Figure 9.**

4. **Start** and **Stop** the device a few times. See that the value of the **Num\_LED\_Flashes** is incremented each time the LED blinks.
5. When the device is halted, click on the value field in the watch window and change the value to 0. Then click the **Refresh** button or select **Debug→Refresh** to write the new value to the device.

**Figure 10.**

6. Start and stop the device a few times to watch the variable increment starting at 0.

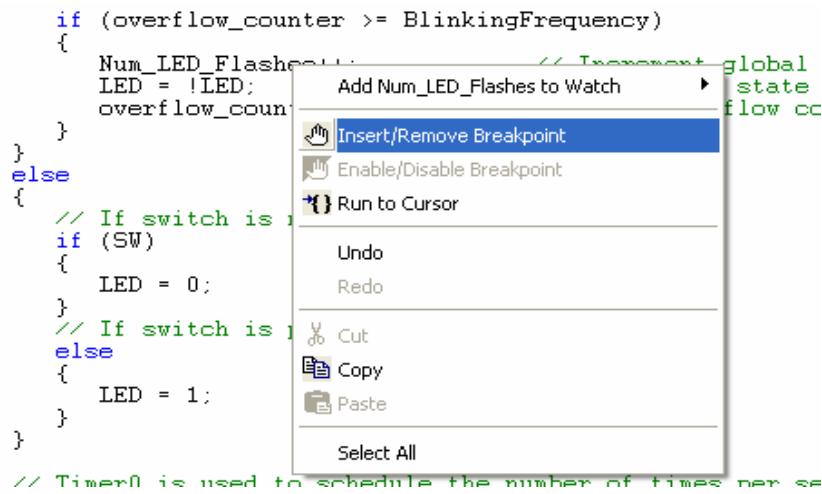

Changing the values of variables does not require recompiling the code and redownloading the firmware. At any time, the device can be halted and the values of the variables can be changed. The firmware will continue execution using the new values.

# ToolStick-F327DC

## 6.6. Setting and Running to Breakpoints

Silicon Laboratories microcontroller devices support up to four hardware breakpoints. A breakpoint is associated with a specific line of code. When the processor reaches a hardware breakpoint, the code execution stops, and the IDE refreshes all debug and watch windows. The on-chip debug hardware allows for breakpoints to be placed on any line of executable code, including code in Interrupt Service Routines. This section provides steps to set a breakpoint on the line of source code that increments the **Num\_LED\_Flashes** variable.

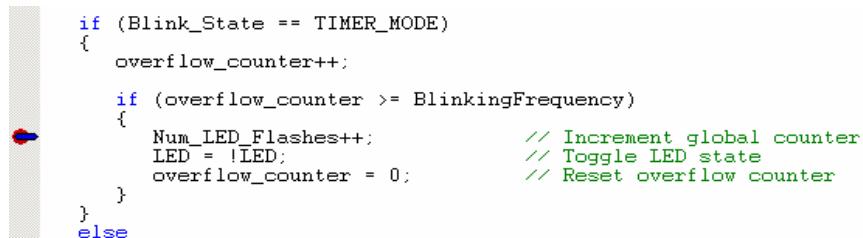

1. If the device is running, stop execution using the "Stop" button or use the Debug→Stop menu option.
2. Scroll to the **TIMER0\_ISR** function and right-click on the variable "**Num\_LED\_Flashes**". In the context menu that appears, select "**Insert/Remove Breakpoint**." On the left side of the line in the editor window, a red circle is added to indicate a breakpoint is placed on the source line.

```
if (overflow_counter >= BlinkingFrequency)
{
    Num_LED_Flashes++;           // Increment global counter
    LED = !LED;                  // Toggle LED state
    overflow_counter = 0;         // Reset overflow counter
}
else
{
    // If switch is 1
    if (SW)
    {
        LED = 0;
    }
    // If switch is 0
    else
    {
        LED = 1;
    }
}
// Timer0 is used to schedule the number of times per second
```

Figure 11.

3. Click the "Go" button or select the Debug→Go menu option.
4. After a short time, the IDE will show that the device is halted. A blue line will be placed in the editor window to indicate where the code execution has stopped.

```
if (Blink_State == TIMER_MODE)
{
    overflow_counter++;

    if (overflow_counter >= BlinkingFrequency)
    {
        Num_LED_Flashes++;           // Increment global counter
        LED = !LED;                  // Toggle LED state
        overflow_counter = 0;         // Reset overflow counter
    }
}
else
```

Figure 12.

5. Start and stop the processor a few more times. Notice that the LED blinks once for every time the processor is started and the **Num\_LED\_Flashes** variable also increments by one.

## 6.7. Single-Stepping Through Firmware

The IDE supports the ability to single-step through firmware one assembly instruction at a time. The IDE reads the Flash from the device, converts the instructions to assembly and displays them in a disassembly window. The following steps show how to open the disassembly window and single step through firmware.

1. If there is already not a breakpoint set on line of code that increments the **Num\_LED\_Flashes** variable, set the breakpoint using the steps described in Section 6.6.
2. Start the processor using the "Go" button and wait till it stops on the breakpoint.
3. Select **View→Debug Windows→Disassembly**. The disassembly window will appear on the right-hand side of the IDE, if it is not already open.
4. To execute one assembly instruction at a time, click the "Step" button on the toolbar or select the **Debug→Step** menu option. The highlighted line in the disassembly window indicates the next instruction to be executed. The blue line marker in the editor window will stay on the same .C source line until all of the assembly instructions are completed.

```

// This ISR is triggered upon a Timer0 overflow. It is used to update the
// UART with the status of the LED.

void TIMER0_ISR (void) interrupt 1
{
    static int overflows = 0;
    static char overflow_counter = 0;
    unsigned int local_blinking_frequency;

    // Timer 0 is used to control the LED on the daughter card. When in
    // TIMER_MODE, a timer overflow counter gets incremented until
    // the terminal value (set in the foreground) is reached.
    // When in BLINK_MODE, the interrupt checks the status of the switch
    // every overflow and turns the switch on or off depending on the
    // logic level of the switch.

    if (Blink_State == TIMER_MODE)
    {
        overflow_counter++;

        if (overflow_counter >= BlinkingFrequency)
        {
            Num_LED_Flashes++;           // Increment global counter
            LED = !LED;                  // Toggle LED state
            overflow_counter = 0;         // Reset overflow counter
        }
    }
}

```

**Figure 13.**

The disassembly window has three columns. The left column is the address of the instruction in Flash. The middle column is the instruction in hex. The right column is the disassembled instruction. The Disassembly debug window and the capability to single-step through firmware allows a developer to see exactly what instructions are executed and their output.

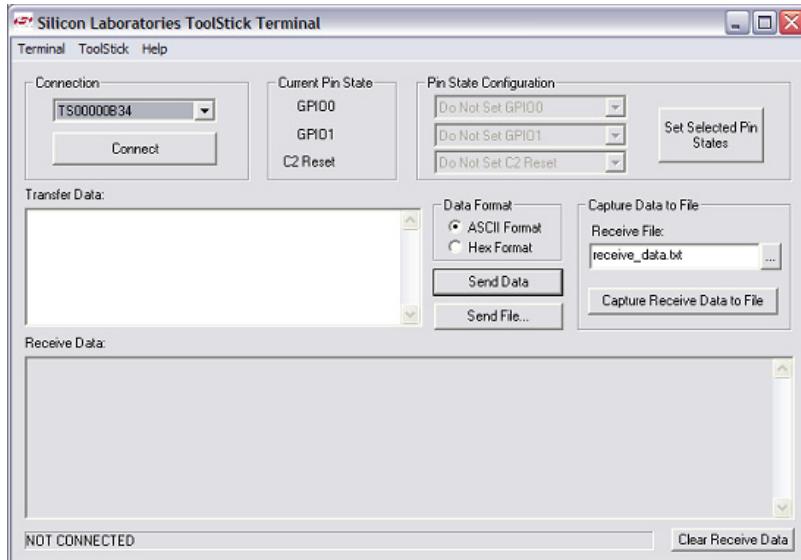

# ToolStick-F327DC

---

## 6.8. Using ToolStick Terminal

This section describes how to use ToolStick Terminal to communicate with UART from the PC to the daughter card through the ToolStick Base Adapter.

1. If the Silicon Laboratories IDE is open, close the IDE. The IDE and the ToolStick Terminal cannot communicate with the daughter card simultaneously.
2. Open ToolStick Terminal from the **Start → Programs → Silicon Laboratories** menu.

3. Go to the **ToolStick → Settings** menu.
4. Under “Pin Settings”, change GPIO0 / RTS to “**GPIO Output - Push Pull**” and click “OK.” The rest of the default settings are correct for the C8051F327 Features Demo.
5. In the top, left-hand corner of the Terminal application, available devices are shown in the drop-down Connection menu. Click “**Connect**” to connect to the device. In the “**Receive Data**” window, text indicating the blink rate of the LED will appear.
6. Press the switch on the daughter card and see that the blink rate is updated on the daughter card and the new blink rate is printed to the Terminal.

In addition to the standard two UART pins (TX and RX), there are two GPIO/UART handshaking pins on the ToolStick Base Adapter that are connected to two port pins on the target microcontroller. ToolStick Terminal is used to configure and read/write these pins. For the **F327DC\_FeaturesDemo**, one of these GPIO pins is connected to an external interrupt pin on the C8051F327. The following steps describe how to change the level of one of the GPIO pins and change the way the target microcontroller controls the LED. When the MCU switches between a timer-based mode where the LED blinks to a mode where the LED is turned on only when the switch is pressed.

1. In ToolStick Terminal, under Pin State Configuration, select “**Set GPIO0 Logic Low**” and click on “**Set Selected Pin States**.” This changes the level of the GPIO0 pin from **Logic High** to **Logic Low** and triggers a level-sensitive interrupt on the microcontroller.
2. In the Receive window, see that the printed text has changed to indicate the LED is off or on.
3. Press the switch on the daughter card to turn on the LED.
4. Change the GPIO0 pin state back to **Logic High** and notice that the firmware switches back to blinking the LED.

The firmware on the C8051F327 target microcontroller does not need to be customized to use the UART and communicate with ToolStick Terminal. The firmware on the microcontroller should write to the UART as it would in any standard application and all of the translation is handled by the ToolStick Base Adapter.

## 7. Additional Demo Example

In addition to the **F327DC\_FeaturesDemo** example firmware, the ToolStick download package also includes a demo project named **F327DC\_HIDMouse.wsp**. The instructions for running this demo can be found at the top of the source file. The project and source files for these demos can be found in the folder, **C:\SiLabs\MCU\ToolStick\F327DC\Firmware\**.

## 8. Using the C8051F327 Daughter Card as a Development Platform

The prototyping area on the ToolStick C8051F327 Daughter Card makes it easy to interface to external hardware. All of the digital I/O pins are available so it possible to create a complete system.

### 8.1. C8051F327 Pin Connections

It is important to note that if external hardware is being added, some of the existing components on the board can interfere with the signaling. The following is a list of port pins on the C8051F327 that are connected to other components:

- P0.0—This pin is connected to the "S1" switch. The switch can be removed to disconnect them from the pin.
- P0.4, P0.5—These pins are connected directly to the ToolStick Base Adapter for UART communication.
- P3.0, P0.7— These pins are connected directly to the ToolStick Base Adapter's GPIO pins. By default, these GPIO pins on the Base Adapter are high-impedance pins so they will not affect any signaling. Configuring these pins on the Base Adapter to output pin or handshaking pins could affect signaling.
- P2.0—This pin is connected to the cathode of the green LED on the daughter card. The LED or the R2 resistor can be removed to disconnect the LED from the pin.

### 8.2. C2 Pin Sharing

On the C8051F327, the debug pins, C2CK, and C2D, are shared with the pins /RST and P3.0 respectively. The daughter card includes the resistors necessary to enable pin sharing which allow the /RST and P3.0 pins to be used normally while simultaneously debugging the device. See "AN124: Pin Sharing Techniques for the C2 Interface" at [www.silabs.com](http://www.silabs.com) for more information regarding pin sharing.

## 9. Information Locations

Example source code is installed by default in the **C:\SiLabs\MCU\ToolStick\F327DC\Firmware** directory during ToolStick installation.

Documentation for the ToolStick kit, including this User's Guide, can be found by default in the **C:\SiLabs\MCU\ToolStick\Documentation** and **C:\SiLabs\MCU\ToolStick\F327DC\Documentation** directories.

The installer for the ToolStick software is available at [www.silabs.com/toolstick](http://www.silabs.com/toolstick).
